# Actionable Intelligence

As the threat landscape evolves and the complexity of incidents grows it is ever more important to have a proactive and intelligence-led approach to risk management and business continuity planning. Central to this strategy is the provision of an Intelligence Centre (VSOC) acting as a centre of intelligence, enabling intelligence to be gathered and analysed, as well as acting as a robust conduit for communication during and post major events.

Joshua Risk is a global incident, crisis and threat management platform delivering end-to-end management for critical events. This analytical platform maps an organisations assets and personnel alongside real-time risk feeds. It then visualises the data using geospatial technologies, giving a single view of risk.

The gathering of high quality data and the ability to share intelligence in real-time is critical, as such the analytics within the platform allow the fast processing of data and instantaneous metrics on specific assets, employees or business functions that may be at risk.

With the proliferation of data sources Joshua Risk will ensure your Analysts do not have sure fire data overload, and that the intelligence received is automatically mapped, categorised, risk-scored and then communicated via embedded communication tools and activity walls.

Joshua Risk allows organisations and government agencies to proactively identify and mitigate threats, safeguard employees, respond fast to operational impacts and streamline communication from security and business continuity teams to on-the-ground employees.

It provides complete situational awareness of incidents and natural disasters that could impact employee safety or business critical operations.

"Joshua Risk seamlessly blends the data together providing fast, accurate and valuable intelligence through a single pane of glass"
